#### INTRODUCTION

The Department of Water Resources is concerned with gathering data of surface water supply and the utilization of the State's surface waters. In addition to the collection of data on operational water supply, the Department is actively engaged in the collection of hydrologic water supply data to augment the base network of the United States Geological Survey.

The work consists of field measurements, observations, and office computations to determine quantities of streamflow and diversions. In addition daily mean gage heights and crests are determined for certain stations, and maximum and minimum stages are determined for tidal stations in the Sacramento-San Joaquin Delta.

The field activities include the construction, operation and maintenance of stream gaging stations, the measurements of (1) flow in streams and drainage channels, (2) the amounts of water returned to natural channels through drainage plants or gravity drains, and (3) the amounts of water diverted for use by water users.

This appendix of the hydrologic data report presents surface water data for the water year 1965 which is from October 1, 1964 to September 30, 1965, inclusive. The streamflow tables herein are arranged, for each stream or stream system, in downstream order. Stations on a tributary

entering between two main stem stations are listed between those stations, and in downstream order on that tributary. A stream gaging station is named from the stream and the nearest post office (Feather River at Yuba City) or well-known land-mark (San Joaquin River at Brandt Bridge).

Included in this publication are the pertinent surface water data formerly included in "Report of Sacramento-San Joaquin Water Supervision" published from 1924 through 1955, in Bulletin No. 23, "Surface Water Flow" published from 1956 through 1962, and in "Flood Flows and Stages in Sacramento and Northern San Joaquin Valleys" published from 1913 through 1956.

The objective of this appendix of the hydrologic data report is to bring together, in a permanent and usable form, the surface flow data for the 1965 water year, gathered by the Department of Water Resources and cooperating agencies.

#### Definitions

Terms used herein are defined as follows:

Cubic foot per second is the unit rate of discharge of water. It is a cubic foot of water passing a given point in one second.

Acre-foot is the quantity of water required to cover one acre to a depth of one foot. It is equivalent to 43,560 cubic feet or 325,850 gallons.

<u>Drainage area</u> of a stream at a specific location is that area, enclosed by a topographic divide, into which

all surface runoff will drain by gravity into the stream above the specified point.

Unimpaired runoff is the flow that would occur naturally at a point in a stream if there were: (1) no upstream controls such as dams and reservoirs: (2) no artificial diversions or accretions; and (3) no changes in ground water storage resulting from development. Unimpaired flow is computed from measured runoff by allowing for man-made changes in natural conditions.

<u>Water year</u> is the 12-month period from October 1 of any year through September 30 of the subsequent year, and is designated by the calendar year in which it ends.

Consumptive use is the water transpired, evaporated, and used in promoting vegetative growth plus the water evaporated from adjacent soil and water surfaces.

#### Methods and Procedures

An automatic water stage recorder is in operation at most of the gaging stations used in this work. The continuous records of water surface elevations at the stations serve three major purposes. First, the relationship of surface elevation (gage height) to flow enables computation of the quantity of streamflow passing the station. Second, the actual surface elevations at two adjacent stations on a stream afford the means of obtaining the water surface elevations at the pumping plants along the stream between those stations. These elevations are used to determine the pumping heads, which in

turn become factors in determining the rates of diversion or drainage by pumping plants. Third, the gage heights are used to determine flood crests.

Quantities of daily mean discharge for most stations shown herein were computed by an electronic computer. Gage height data are extracted from standard recorder charts by a semiautomatic reading machine and put into machine language. The gage height data and rating data are fed into the computer simultaneously, from which daily mean discharges, total monthly acre-feet, and instantaneous maximum and minimum discharges are computed. Records of gaging stations which are affected by a backwater or ice condition are not adaptable to computation by machine, hence are computed manually.

Quantities of water diverted for use are computed as a regular part of the office work. The acre-foot quantities for most diversion points are computed from pumping plant efficiency curves which are developed from a series of instantaneous discharge measurements. The electric power input, the pumping head, and the discharge are recorded simultaneously to compute the efficiency of a pumping plant. This recording of pumping data is done as part of the field work previously mentioned. The office work involved required the development of the efficiency curves and the computation of the monthly acre-feet by using the monthly electric power input records. The amount of water diverted by gravity was determined either by calibrating suitable measuring devices or by rating canals. For quantities diverted by gravity and subirrigation from

tidal affected streams, consumptive use factors were applied to the irrigated area.

The major crests reported herein are the observed or recorded gage height reading, excepting those major crests of record for gaging stations located in areas of subsidence. Those crests were correlated to a gage datum survey conducted in 1964. This survey tied all gage datums in the Delta area to USC&GS mean sea level datum. The rate of subsidence for each gaging station was determined by prorating the difference between the 1964 datum and the last previously determined datum. Adjusted gage heights were then used to determine the actual crest of record.

The elevation of the water surface at a gaging station is obtained by adding the gage height readings to the elevation of the gage datum.

#### Accuracy

The daily mean flow rates shown in this report are from rating curves based on field measurements of flow. Whenever the reported flow exceeds by 140 percent the highest flow measurement on which the rating was based, the flow rate is shown as estimated.

### Significant Numbers

All streamflow data reported herein are derived through the use of mechanical, arithmetical, and empirical operations and methods. Since the results are affected by inherent inaccuracies in the procedures and equipment used,

it becomes necessary to establish limits for which the data are reported. The following is a listing of significant figures used in reporting streamflow data:

1. Daily flows - second-feet

0.0 - 9.9 Tenths 10 - 99 2 significant figures 100 - up 3 significant figures

2. Monthly means - second-feet

0.0 - 99.9 Tenths 100 - 999 3 significant figures 1000 - above 4 significant figures

The water year totals of streamflow are reported to a maximum of four significant figures, and not less than units. Monthly diversion values are reported in acre-feet to three significant figures. The totals for individual water users and stream reaches are reported to four significant figures. Gage heights for stage tables are reported to either the nearest tenth of a foot or one-hundredth of a foot.

Those streamflow data received from cooperating agencies do not necessarily adhere to the above criteria. These data are published as received, excepting that rounding off of certain figures are necessary to make the data compatible to the Department's machine programs, which produce the tables in this report.

## Coding

To facilitate station identification, each gaging station was assigned a six digit code. The method used in assigning these code numbers is as follows: The State was

first divided into major hydrographic areas and each of these areas was assigned an alphabetic letter which is the first symbol of the six part code. The second symbol was obtained by dividing the major hydrographic areas into stream basins of primary importance and assigning a digit from 0-9 with 0 generally being the valley floor. The symbol indicates the stream and/or branch on which the station is located. Where a stream crosses a valley floor, the third symbol indicates the river basin from which the stream originates and the fourth symbol now designates the stream. The last three symbols designate the relative number of the station on the stream system, except in the valley floor, where the last two symbols indicate the relative number. Station numbers increase numerically proceeding upstream. When a minor tributary enters the stream system, the station numbers progress up the minor tributary and then up the main stem.

The first two symbols of this code number, encircled on Plates B-1 and B-2, signify the following hydrographic areas and basins:

#### Hydrographic Area A Sacramento River Basin

Stream Basin

A-O Sacramento Valley Floor A-5 Feather Rive A-1 Pit River A-6 Yuba-Bear Ri A-2 Shasta Lake A-7 American Riv A-3 Sacramento Valley West Side A-8 Cache Creek A-4 Sacramento Valley Northeast A-9 Putah Creek		Sorcam Dastin

Relative Number 3 5

### Explanation of Tables

### Runoff Comparisons

The relative magnitude of runoff occurring on any one stream during a given year may be shown as the ratio of the runoff of that year with the average runoff of the stream expressed as a percentage. For this report, the average unimpaired runoff is computed for the 50-year period October 1910 through September 1960. Table B-1 presents, for the major streams of the Central Valley area, the 1964-65 monthly unimpaired runoff expressed as a percent of the 50-year average monthly unimpaired runoff. Table B-2 shows the unimpaired average annual runoff for the same streams and the percentage of the 50-year average unimpaired runoff for each water year from 1924-25 through 1964-65.

## Summary of Water Supply and Utilization, Sacramento-San Joaquin Delta

The complexity of waterways, tidal action, seepage, and methods of agricultural water use results in hydrologic problems which preclude normal methods of measuring water supply and water utilization in the Sacramento-San Joaquin Delta.

The correlation of water supply and use for the Delta Service area, divided into uplands and lowlands, is shown in Table B-3. The water supply available to the area is determined from 16 gaging stations, listed under "Water Supply" in the table, and from 10 precipitation stations. "Water Utilization", in the same table, includes agricultural use, evaporation, exports through the Delta-Mendota and Contra Costa Canals, and diversion for the City of Vallejo. Agricultural use in the uplands is determined by direct measurements of diversions; however, in the lowlands, because it cannot be measured directly, agricultural use is computed by unit values of consumptive use of the various crops, multiplied by the acreages. Unit values of consumptive use were derived from experimental work by the University of California and California Extension Service as reported in Bulletin No. 27 "Variations and Control of Salinity in Sacramento-San Joaquin Delta and Upper San Francisco Bays". Crop acreages are determined by periodic land use surveys. Values used in this report were determined from a survey made in 1960 and 1961.

## Gaging Station Additions and Discontinuations

Table B-4 lists gaging station additions during the report year. Also listed are those stations discontinued

during or at the end of the report year.

#### Daily Mean Discharge

The streamflow Table B-5 shows the daily and monthly discharge quantities and in addition, the gaging station location, the historic maximum discharge, the maximum discharge for the report year, period of record, and the datum of gage.

#### Streamflow Measurements at Miscellaneous Sites

Table B-6 contains tabulations of measurements of streamflow on various streams at locations other than those where daily mean discharge is reported. When the flows as shown are correlated with flows of nearby streams, an estimate of the runoff can be determined.

Included as miscellaneous measurements are results of tidal cycle measurements made in channels having flows affected by tidal action. The results of these measurements are the mean cyclic flow for four tides, which approximates 24 hours and 50 minutes in time.

#### Diversions

Quantities of water diverted for use, names of water users, type of diversion, and diversion location by river mile are shown on Table B-7. The diversion quantities are shown as monthly total acre-feet and total acre-feet diverted for a stream or certain reach of a stream. While the major use of water is for agriculture, small amounts that are diverted for municipal and industrial uses are also reported.

#### Deliveries from Folsom and Nimbus Reservoirs

The monthly deliveries in acre-feet to the Natomas Water Company and San Juan Suburban Water District are shown in Table B-8.

#### Exportations from Northeastern California

Monthly exports in acre-feet from the report area are shown in Table B-9. Exports are via the Mokelumne River Aqueduct, Putah South Canal, the City of Vallejo's diversion from Cache Slough, Contra Costa Canal, and the Delta-Mendota Canal.

#### Importations into Northeastern California

Imports into the report area are from the Trinity River to Whiskeytown Lake and are shown in Table B-10.

#### Daily Mean Gage Height

Two types of daily data are presented for the height or stage of water surface: (1) for streams not influenced by tidal action, daily mean gage height or an average of one or more daily stage readings; and (2) for streams subject to tidal influences, daily maximum and minimum gage heights. Major river crests for the water year are shown with the stage tables, and maximum crest of record are shown in the station description. Daily mean gage height are shown in Table B-11, and daily maximum and minimum gage height in Table B-12.

#### Reservoirs

Two types of data are presented for the major lakes in the report area: (1) daily content in acre-feet for Antelope, Folsom, Frenchman, Berryessa, and Shasta Lakes are shown on Table B-13; and (2) mean daily inflow in second-feet for Folsom, Shasta, and Whiskeytown Lakes on Table B-14.

#### Corrections and Revisions to Previously Published Reports

Table B-15 is a tabulation of corrections and revisions to Bulletin No. 130 for all the years published (1924 to-date). Additions to this report are asterisked (\*) to denote changes not previously reported.

<sup>\*</sup> Preliminary data subject to revision.

\*\* Average unimpaired runoff in thousands of acre-feet computed from the 50-year period October 1910 through September 1960.

\*\* Figures were computed from summations of unimpaired runoff at foothill stations on major tributaries only and do not include runoff from minor tributaries and from the valley floor.

Table B-3

# SUMMARY OF MONTHLY WATER SUPPLY AND UTILIZATION SACRAMENTO-SAN JOAQUIN DELTA

In thousands of acre-feet

Water supply from precipitation has been computed using weighted monthly mean rainfall and the acreage of the Delta Service area.

b Consumptive use in the Delta Lowlands has been computed using monthly unit consumptive use factors for classified vegetation and evaporation, and acreage data obtained through the land use survey of 1961.

Station located at county road bridge, 5 miles west of Alturas. Stage-discharge relationship at times affected by temporary diversion dam approximately 3 miles below station and also by ice. During periods of backwater affect by dam, flow listed is not considered to have the same degree of accuracy as other records published in this report. Flow is regulated by many small reservoirs.

Station located 4.0 mi. E. of Colusa, 3.7 mi. N of Meridian. Tributary to Sacramento River. Flow regulated by gravity culverts. These flows, together with flow of Butte Slough at Mawson Bridge and Wadsworth Canal near Sutter are, during the summer months, made up almost entirely of return water from lands irrigated by Feather River diversions.

8 - Irrigation season only.

Station located W of N end of weir, 5.0 mi. SE of Grimes. See Sacramento River at Tisdale Weir for stage records. Elevation of weir crest is 45.45 ft. U.S.E.D. datum; length of crest is 1,155 ft. Backwater from Sutter Bypass at times affects stage-discharge relationship. Maximum gage height listed does not necessarily indicate maximum discharge.

# - Flood season only.

Station located at Knights Landing Outfall Gates, 0.3 mile west of Knights Landing. Tributary to Sacramento River. Flow regulated by outfall gates. An undetermined amount of flow is diverted to Yolo Bypass via Ridge Cut at Knights Landing. For total flow to Sacramento River, combine with flows of Reclamation District 787 to Colusa Basin Drain. Maximum gage height listed does not indicate maximum discharge.

 $\ensuremath{\delta}$  - Irrigation season only.

Station located at West Butte-Meridian Highway bridge, 3.0 miles north of Meridian. Tributary to Sutter Bypass. Flow affected by gate operation. Flow during summer months is made up almost entirely of return water from lands irrigated by Feather River diversions. During flood periods, Sacramento River water enters Butte Basin above Butte City by bank spill and spill over Moulton and Colusa Weirs.

# - Flood season only.

Station located on downstream side of South Butte Road Bridge, 0.9 mi. E of Sutter. Tributary to Sutter Bypass. Maximum gage height listed does not necessarily indicate maximum discharge. This station and one 2.2 mi. downstream are used to determine slope for rating of canal. This flow and flow of Butte Slough to Sutter Bypass make up entire Feather River contribution to the Sutter Bypass. Prior records, January 1939 to March 1961, available at a site approximately 0.3 mile upstream.

Station located 0.5 mi. above mouth, 4.6 mi. SE of Knights Landing, During low flows this represents combined flows of Sutter Bypass and Reclamation District 1500. During high flows (above gage ht. 29.0-) the slough is entirely submerged as it lies within the bypass area. Sharp rises in the Sacramento River cause zero or negative flow.

A - An undetermined amount of negative flow. F - Flooded.  $\ensuremath{\delta}$  - Irrigation season only.

Station located at toe of Frenchman Dam, 7.1 mi. N of Chilcoot. Flow regulated by Frenchman Lake. At times, extremely heavy precipitation, off the face of the dam entering above the measuring weir, contributes additional flow.

Station is located at the outlet of the relocation tunnel of Palermo Canal. On completion of Oroville Dam, it will be located 50 ft. SE of toe of the Dam. This is water diverted by the Oroville-Wyandotte Irrigation District from the South Fork Feather River near Forbestown. Overflow from batching plant which enters the channel between the tunnel and the station is included. Since May 1, 1965, the tunnel has been blocked with mud.

Station located approx. 4 mi. S of Yuba City. Flow partly regulated by reservoirs and power plants. High flows rated by means of simultaneous current meter measurements of Yuba River near Marysville and Feather River at Yuba City. Record listed is not considered to have the same degree of accuracy as other records published in this report. Drainage area is 5,337 sq. mi.

0 - Irrigation season only # - Flood season only

Plant located 3.0 mi. NW of Sacramento. Discharge computed from records of operation of pumps. This is drainage returned by pumping. Reclamation District 1000 returns additional drainage to the Sacramento River via No. 3 and Prichard Lake Plant and to Natomas Cross Canal via No. 4 Plant. Computation of data discontinued Oct. 1, 1965.

" - Irrigation season only

Station located at Airport Way bridge, 1.5 mi. E of French Camp. During periods when backwater from a temporary diversion dam affects the stage-discharge relationship, a supplementary water stage recorder, located 0.5 mi. downstream on the bypass, is used for computations. Tributary to San Joaquin River. Maximum discharge listed at site and datum then in use.

Station located at Laurel Ave., 1.0 mi. W of U. S. Highway 99, immediately S of Stockton. Tributary to San Joaquin River via French Camp Slough. During high flow, water from Duck Creek enters Mormon Slough approx. 2 mi. E of the head of Stockton Diverting Canal. Discharge listed does not include this overflow. Flow regulated by gravity culverts which divert to Littlejohn Creek. Maximum discharge listed at site and datum then in use. An undetermined amount of flow bypassed the station during August and September 1965, when the channel was realigned realigned.

Station located 0.2 mi. above Farmington-Bellota Highway bridge, 0.2 mi. E of Bellota. Flow regulated by Hogan Reservoir. During irrigation season, flow is reregulated by boards placed across diversion dam immediately downstream which control division of water between the Calaveras River and Mormon Slough. This is flow from Calaveras River which is returned to the river via Stockton Diverting Canal.

Carries return water from Colusa Basin along west border of Reclamation District 108 and 787, and then discharges to Sacramento River at Mile 34.15R or partial diversion via Knights Landing Ridge Cut.
Mileage along Colusa Basin Drain from junction with Sacramento River.
New installation in 1965.

<sup>\*</sup> Mileage on Butte Creek from junction with Butte Slough at Mile 0.68.

\* Mileage on Butte Slough from junction with Sacramento River at Mile 84.0L.

Installed prior to 1965. Not previously reported.

No record. Owner refused permission to enter property.

\* New installation in 1965.

Diversion is estimated.

One 20" unit a temporary installation in 1965.

Temporary installation in 1965.

Replaces a 10" and a 12" unit.

Jone 16" unit installed in 1965.

k Flow in Butte Slough derived from Eutte Creek, is controlled by outfall gagea at junction with Sacramento River and is thereby retained in Eutte Slough to discharge into East and West Eorrow Pits of Sutter Eypass near "Long Eridge". The outfall gates are maintained by the Department of Water Resources and are operated cooperatively with the Butte Slough Irrigation Company. See Sutter Eypasa Diversions.

m Formerly listed as Granniman and Fieth.

- Mileages on West Borrow Fit are given northerly from drain plant of Reclamation District 1500. Mile 9.15 on West Borrow Fit is opposite Chandler.
  Mileages on East Borrow Fit are given northerly or southerly from Chandler.
  Flant is on main drain canal for Drainage Flant No. 1 that joins East Borrow Fit of Sutter Bypass at Mile 1.4N. Figure in parentheses indicates distance along drain from East Borrow Fit. Flant is on drainage canal for Drainage Flant No. 2 that joins East Borrow Fit of Sutter Bypass at Mile 10.0N. Figure in parentheses indicates distance along drain from East Borrow Fit. Flant is on Wadsworth Canal that joins East Borrow Fit of Sutter Bypass at Mile 16.5N. Figure in parentheses indicates distance along canal from East Borrow Fit of Sutter Bypass at Mile 16.5N. Figure in parentheses indicates distance along canal from East Borrow Fit of Sutter Eypass at Mile 16.7N. Figure in parentheses indicates distance along creek from East Borrow Fit.
  Station located on bridge at or near center of stream.

- a Water used for irrigation in Sutter Bypass is mainly Feather River return water which enters East and West Borrow Pits via Butte Creek, Butte Slough, and Wadsworth Canal.
  b Indicates area irrigated is within Bypass.
  c New installation in 1965.
  d One 16" unit was installed in 1965.
  e Previously listed as a 10" unit.
  f Replaces a 14" unit.
  g One 14" unit was removed in 1965.
  h Formerly listed as R. J. Hughes No. 2.
  i One 8" unit was installed in 1965.
  J Replaces a 16" unit.
  k Replaces a 10" unit.
  one 12" unit was installed in 1965.
  n Temporary installation in 1965.
  p Formerly listed as Frank Amaral.

- Mileage along Old can Joaquin River from mouth of can Joaquin River of alles below Antioch.
  Mileage along Tom Raine Slough from its mouth at Mile 54.3L on Old San Joaquin River.
  Mile and bank above mouth.
  Holly Sugar Corporation dredger cut joins Tom Paine Slough at Mile 2.12. Oistance along dredge cut and bank is shown in parentheses.
  Station located on bridge at or near penter of stream.
  Rock Slough joins Old San Joaquin River at Mile 30.5L.
  Pumping plant is located on intake canal which joins Rock Slough.
- b Indian clough joins old Jan Joaquin River at Mile 36.4L. Pumping plant is located on intake canal which joins Indian Clough.
  Ltalian Clough joins Old San Joaquin River at Mile 40.9L. Fumping plant is located on intake canal which joins that it is located on intake canal which joins the Old San Joaquin River at this mile.
  Formerly listed as J. R. Colburn and Fred H. Draper. Flant is located on Mountain House Creek which joins the Old San Joaquin River at this mile.
  Industrial use only,
  Includes an undetermined amount of spill to the river.

The diversions for the entire Putah Creek below Monticello Dam
are shown on page

# Station located on bridge at or near center of stream.

a Formerly listed as Vaughn and Vassar. b Portable units used at miles indicated.

a Includes an undetermined amount of relifted drainage water.

b One 14 unit was removed in 1964.

c Portable unit used at miles indicated.

d This is a portable unit.

<sup>\*</sup> Figures represent North Townships, East Ranges and Sections. Letters represent the 1/4- 1/4 sections which are lettered from A through R excluding I and O, similar to the numbering of sections within a township.

a New installation in 1965.
b Includes an undetermined amount of Woodbridge I. D. drainage water. c Replaces an 8" unit. d Gravity removed.

e No record, lessee refused permission to enter property.
f Includes an undetermined amount of Marsh Creek water.
g Installed prior to 1965. Not previously listed.
h Diversion in 1965 was all controlled drainage water.
J Estimated consumptive use on lands in the Delta Uplands, considered as subirrigated from tidal channels during 1965 without a specific point of diversion.

Station located 2.3 miles southwest of Hamilton City, 6 miles above mouth. Tributary to Sacramento River. Flow regulated by East Park Reservoir and Stony Gorge Reservoir. Flow to Sacramento River is cut off during irrigation season by an earth fill installed by Glenn-Colusa Irrigation District to transport water from their main canal across Stony Creek. Records furnished by USGS. Drainage area is 764 square miles.

Station located 0.1 mile below highway bridge, 1.7 miles east of College City. Flow is drainage chiefly from lands irrigated by Glenn-Colusa, Provident, Princeton-Codora-Glenn, Compton-Delevan, and Maxwell Irrigation Districts. Backwater from Knights Landing Outfall Gates at times affects stage-discharge relationship. Maximum gage height listed does not necessarily indicate maximum discharge.

Station located just above the Southern Pacific Railroad bridge, 13.1 miles above Feather River immediately northeast of Knights Landing. Station affected by back water from Feather River and Sutter Bypass during periods of high flow. Maximum discharge of record listed is for period 1940 to date. Records furnished by USGS. Maximum gage height listed does not necessarily indicate maximum discharge.

8 - Irrigation season only.

,							10/37-DATE				

Station located at West Butte-Meridian Highway bridge, 3.0 miles north of Meridian. Tributary to Sutter Bypass. Flow affected by gate operation. Flow during summer months is made up almost entirely of return water from lands irrigated by Feather River diversions. During flood periods, Sacramento River water enters Butte Basin above Butte City by bank spill and spill over Moulton and Colusa weirs.

# - Flood season only

Station located on downstream side of South Butte Road Bridge, 0.9 miles east of Sutter. Tributary to Sutter Bypass. Maximum gage height listed does not necessarily indicate maximum discharge. This station and one 2.2 miles downstream are used to determine slope for rating of canal. Prior records, January 1939 to March 1961, available at a site approximately 0.3 mile upstream.

Station located just above the Sacramento-Woodland Railroad bridge, 6 mi. above the Sacramento Bypass, 7 mi. below Fremont Wein, 7 mi. E of Woodland. Supplementary water stage recorder, located 7 mi. downstream, used for computations during periods of low flow. Stage-discharge relationship at supplementary recorder location at times affected by tidal action. Records furn. by USGS.

Station located 0.2 mi. above head of Slough (leveed off from river), W of State Highway 160, 2.5 mi. NE of Gourtland. Station located in tidal zone. Maximum gage ht. listed does not necessarily indicate maximum discharge. At times, tidal fluctuation is influenced by operation of the Delta Cross Channel gates.

DELTA CROSS CHANNEL AT WALNUT GROVE

Station located north of Clifton Court Road, 3.1 mi. SE of Byron. Station located in tidal zone. Maximum gage ht. listed does not indicate maximum discharge. From Oct. 1 to May 12, a partially plugged intake affects the recording of gage heights; as a result the record contains varying degrees of inaccuracies.

Station located approx. 1.5 mi. 8 of NE corner of Holland Tract. Station located in tidal zone.

Maximum gage ht. listed does not indicate maximum discharge. Maximum of record is maximum recorded stage - record not complete in December 1955. Station discontinued Sep. 24, 1965.

MORELLIMNE RIVER NEAR THORNTON

Station located on Sherman Island, 4.9 mi. 2 of Rio Vista. Station located in tidal cone.
Maximum gage ht. listed does not indicate maximum discharge. Maximum of record is maximum recorded stage - record
not complete in December 1955. There are indications of a partially plugged intake pipe which would result in
varying degrees of inaccuracies.

Station located at toe of Antelope Dam on Indian Creek, 1.3 mi. S of Boulder Creek Guard Station, 12 mi. NE of Genesee.

Antelope Dam was completed in July 1964; however, usable storage began on Dec. 27, 1963. The lake has a usable capacity of 22,239 acre-feet between elevations 4950 ft. (lip of intake tower) and 5002 ft. (crest of spillway). Not available for release, 274 acre-feet.

Daily content given is shown at 2400 hr.

Station located 0.7 ml. below So. Fork American River, 2.3 ml. NE of Folsom. Records furn. by USBR. Drainage area is 1,862 sq. mi.

Folsom Reservoir has a usable capacity of 1,010,300 acre-feet between elevations 205.5 ft. (invert of lower tier of river outlets) and 466.0 ft. (gross pool elevation), all of which is available for release. Spillway design flood pool elevation is 475.4 ft. (capacity 1,120,200 acre-feet).

Daily content given, representing usable content, is shown at 2400 hour.

The figures contained herein are computed inflow to Shasta Lake and take into account change in storage, release, spill, precipitation, and evaporation. They are representative of the natural flow which would pass the damsite (9.5 miles north of Redding) if the dam had not been constructed. Records furnished by USBR. Drainage area, excluding Goose Lake Basin, is 6,665 square miles.

Shasta Lake has a usable capacity of 4,377,000 acre-feet between elevations 737.75 and 1,065.0 feet above mean sea level. Not available for release, 115,700 acre-feet.

The figures contained herein are computed inflow to Folsom Reservoir and take into account change in storage, release, spill, precipitation, and evaporation. They are representative of the natural flow which would pass the damsite (2.3 mi. NE of Folsom) if the dam had not been constructed. Records furnished by USBR. Drainage area is 1,862 sq. mi.
